## Storyboards & Description

This will be the usual snake and ladder game which can be played online with matched players- designed using SQL as database management script. The players login details, position on board, and high score will be stored in the database.

The screens will be as follows:

### 1. Login Screen

## Register / Login

username

password

Start New Game

Continue Last Game

If the username is not registered it will register with a new user. If already registered, the system will check for the password and login the user. The user can continue the last game or start a new game.

## 2. Game Board

The user will click on the dice to generate a random number between 1-6 and the user's stick will move the number of steps equal to the dice number. If the user steps on a field with a snake or ladder object, they will move to the corresponding field.

### 3. Admin Panel

# Admin Panel

Manage Players

Kill running games

The admins will be able to add or remove players from the admin panel and also stop running games.
